TYPE: Guidelines DEPARTMENT: Clinical

SECTION: National Centre for Farmer Health

PURPOSE

WDHS is based in an agricultural area that produces livestock. As part of livestock husbandry veterinary chemicals are used. Occasionally needlestick injuries occur which may have poor outcomes if not treated correctly. To provide a table of livestock injection products and recommended treatment options.

Whilst due care has been taken with compiling this document it is not a complete list of all animal health products (vaccines, drenches, antibiotics and mineral supplements) that if accidentally self-administered have potential to cause injury.

No responsibility can be held by the authors for how this information is used and outcomes. Readers must independently verify recommendations contained in this document.

TARGET AUDIENCE/SCOPE

Emergency Department staff

VMO's, HMO's

Nursing staff if admitted

DEFINITION/S OF KEYWORDS

APVMA Australian Pesticides and Veterinary Medicines Authority

NCFH National Centre for Farmer Health

CLINICAL ALERT

All animal health companies with products registered with the APVMA have a legislated requirement to report human exposure to their products to the APVMA but they can only do this, if notified of incidents. Please note that agriculture workers, and farmers can and should report the adverse event to the APVMA and be encouraged to do so. They do not have to wait for the animal health company to do it. Similarly health and medical professionals, VMO's, HMO's should also report to the APVMA.

For all mineral oil needlestick injuries a surgeon must be contacted, regardless of self - reported category of injury.

EQUIPMENT

https://apvma.gov.au/sites/default/files/images/311-adverse-experience-reporting-form.pdf

https://portal.apvma.gov.au/aerpexternal/welcome.htm

Please keep a copy of the APVMA adverse report to go into health record

PROCEDURE/PROTOCOL/GUIDELINES

See Appendix 1

CONSUMER INFORMATION

N/A

EXPECTED OUTCOME

Patients optimally treated first time for needlestick injuries from animal health products.

Medical and Nursing staff utilise procedure

Adverse events are reported to the APVMA.

Farmers and agricultural workers are provided with copy of Farmer needlestick injuries brochure.

EVALUATION

Annual review of needlestick cases to Emergency Department and whether they were treated appropriately undertaken by NCFH.

Appendix 1 Table of Livestock Injection Products 1.

Farmer Needlestick Injuries Risk & Recommended Treatment

David Rendell¹, Sue Brumby², Richard Lunz², Scott McCombe², Stephen Clifforth³, Kelley Donham⁴ - updated 2021

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Vaccines that contain Mineral Oil (also known as Paraffin Oil) adjuvants	Mineral oil when injected into tissue is non-degradable and highly irritant	Recommended Treatment following self-inoculation of Mineral Oil or Paraffin Oil Adjuvant Vaccines
Vaccines include: 1. Gudair (Sheep Johnes Disease) 2. Silirium (Cattle Johnes Disease) 3. Piliguard (Cattle Pink Eye) 4. Rotavec Corona (Calf scour vaccines) 5. Vibrovax (Cattle Vibrio) 6. Bovilis MH & MH/IBR vaccines (Cattle respiratory diseases) 7. Bovilis S (Cattle Salmonella) 8. Ovills Campyvax (Sheep abortion) Note: The adjuvant contained in vaccines 1- 5 can be referred to as Freunds Note: Vaccines 6 to 8 also contain mineral oil but is mixed with an 'Emulsigen' oil in water	Accidental self-injection of these vaccines (1-8) can cause serious local reactions both short and long term. Note - refer to Mr Stephen Clifforth or onto nearest hospital /emergency service with information on vaccine type. Emulsigen oil in water precise nature is not disclosed, is less irritant but can still cause serious local reactions. Note: Elevation can increase pain intensity from spread of paraffin oil adjuvant due to gravity	Category 1 injury (superficial skin exposure). Wash the contaminated area in warm soapy water. If vaccine material is splashed onto mucosal surfaces (e.g. eyes) there is greater risk and topical corticosteroids should be considered here Category 2 injury (needlestick injuries without injection). Allow the wound to bleed freely and do not squeeze or interfere with the injection site. Clean the wound thoroughly with soap and water, and keep it clean and dry. NB: All mineral oil category 2 injuries are to be treated as if category 3 and reviewed by surgeon. Ensure appropriate tetanus cover; prescribe topical corticosteroids and oral antibiotics to prevent opportunistic infection). Category 3 injury (injection of vaccine material). Acute pain and inflammation is usually immediate, intense and persists for at least 24 hours. Perform early surgery and drainage to remove the oil-based vaccine material before it spreads or elicits a severe granulomatous reaction. Category 4 injury (Needlestick injury that has progressed to necrosis or granulomatous ulceration). Perform surgical debridement to remove any residual vaccine material. Skin grafting may ultimately be required.

Prompt Doc No: WDHS0010119 v4.0	Page 4 of 11	Last Review Date: 21/06/2021

TYPE: Guidelines DEPARTMENT: Clinical

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Vegetable Oil Based Adjuvants	Moderately irritant	
Arrachis (peanut) cotton seed & sesame oil	Accidental self-injection of these can cause local reactions depending on amount and location. Note: tendon	If possible the application of gentle squeezing pressure with absorbent material (e.g. facial tissue) at the injection site will swab up unabsorbed material. Strong squeezing of the site should be avoided. The damaged area should be
Injectable DrenchesDectomax 70% sesame oil	sheaths more irritant	thoroughly cleansed and a topical antiseptic applied.
Hormones	Dectomax post injection slaughter study in cattle by Pfizer claim low	Treat symptomatically (e.g. ensure appropriate tetanus cover; prescribe topical corticosteroids and oral antibiotics to prevent opportunistic infection).
 Testosterone e.g. Ropel, Tepro and Testoprop Progesterone oestradiol (Crestar) 	tissue irritant. Industry experience shows vegetable oil adjuvants are much less reactive in animals than	Less likely to need surgical flushing or debridement but NZ case indicates need to review this
Antibiotics Moxylan	mineral oil or Paraffin oil adjuvant vaccine	Medical grade "arachis" oil (peanut oil) too refined to cause peanut allergy
Excenel	NZ farmer Excenel NSI case required extensive debridement and skin grafts see Ref	
Specific adjuvant not disclosed	Moderately irritant	
Vaccine: 1. Singvac 1 & 3 non-mineral double oil emulsified base?	Unable to get more detail as to precise nature of these. Anecdotally Singvac causes intense reactions	Consider surgical flushing if acute pain and inflammation within 24 hours
Drench 2.Cydectin LA "Water miscible non-aqueous solution".	Cydectin LA has caused at least one intense NSI reaction that required surgery to flush and remove oil	
Eweguard, Weaner Guard	Low irritant. Adjuvant not specified and manufacturer only disclose confidentially to a Dr treating a case	Manufacturers claim similar risk to water based and Aluminium adjuvant vaccine see below *

Prompt Doc No: WDHS0010119 v4.0	Page 5 of 11	Last Review Date: 21/06/2021

TYPE: Guidelines DEPARTMENT: Clinical

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Pestiguard, Eryvac, Ultravac. Botulinium water based Aluminium adjuvant vaccines	Very low irritant. Risk of infection as with all livestock injections due to reuse of needles and working in a relatively dirty environment	As per normal needlestick infection
Solvent:	Less likely to be irritant	
Glycol solvent injections	Injected - Effects vary in severity according to the quantity e.g. localised site reaction (pain, redness, and	Symptomatic treatment as unlikely to need surgical flushing and debridement
E.g. Paramectin injection drench	swelling) to a more acute systemic reaction	Advice to Doctor Poisoning by may cause neurological symptoms. Treat symptomatically. Require large dose~ 50 x dose safety margin
	Skin - Poisonous if absorbed through skin. May irritate the skin	
Water based & aluminium adjuvant vaccines	Low irritant Relatively low irritant adjuvant,	Symptomatic treatment as most unlikely to need surgical flushing and
Sheep 5 in 1 & 6 in 1 vaccine e.g. Glanvac, Ultravac,Tasvax	main risk is opportunistic infection from needle contamination	debridement unless infection introduced at time of injection
Cattle 5 in 1 and 7 in 1 vaccines e.g. Cattle vax Ultravax	Some risk of hypersensitivity from injection. Contains safety	
Adjuvant not specified	tested inactivated bacterial toxins	
	Many contain ~0.05% formalin Category 2 carcinogen – but insufficient quantity to be risk

TYPE: Guidelines DEPARTMENT: Clinical

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Potentially Toxic: Hormones Oxytocin e.g. Syntocin	Self-Injection can induce premature labour	Not to be used by pregnant women
Prostaglandins (PG) Cloprostenol,e.g. Estramil, Juramate Dinoprost E.g. Lutalyse	If self-injected or comes into contact with skin Causes abortion in pregnant women. May cause bronchospasm in humans. May cause peritonitis if have a pyometral condition with a stenosed cervix.	If possible the application of gentle squeezing pressure with absorbent material (e.g. facial tissue) at the injection site will swab up unabsorbed material. Strong squeezing of the site should be avoided. The damaged area should be thoroughly cleansed and a topical antiseptic applied. Seek immediate medical attention if self-inject
Ovastim sheep vaccine	Accidental self-injection may affect fertility in both women and men, and pregnancy. A mild transient swelling may occur at the injection site	As above
Bopriva cattle vaccine	As Above do not use if of child bearing age or have had NSI with this product	As above
Oestradiol /progesterone e.g. "Crestar" injection® (intervet)	Wide number of potential side effects and contradictions in people particularly those with depression	As above

TYPE: Guidelines DEPARTMENT: Clinical

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Antibiotics with specific toxicity Mictotil Tilmicosin	Injection of Micotil 300 in humans has been associated with fatalities and cardiac arrest	In case of human injection, consult a doctor immediately and apply ice or cold pack to injection site while avoiding direct contact with the skin. Minimise movement and do not massage injection site.
	Caution Statement: Tilmicosin phosphate is classified as a severe allergen because repeated unprotected exposures are likely to cause allergic reactions. Effects of exposure may include changes in heart rate/rhythm and heart tissue changes.	Contact Poisons Information Centre on 13 1126. NOTE TO DOCTOR: The cardiovascular system is the target of toxicity and should be monitored closely. Cardiovascular toxicity may be due to calcium channel blockade. IV calcium reverses symptoms Epinephrine contraindicated
Most animal medications including antibiotics (eg pencillins and oxytetratraclines) and anthelmintics (worm treatment)	Possible allergic reaction. Whilst risk is highest if self-injected severe allergic dermatitis has been reported following skin exposure of minute traces. Risk of sensitisation with contact over time.	Persons with hypersensitivity or anaphylactic reaction must receive immediate medical attention.
Live vaccine infectious to humans Scabby guard	Infectious to humans Skin Irritation and very slow healing wound with crusty scab (Orf)	Rinse area and apply disinfection procedures. Do not use brush or use abrasive material to wash as can cause skin trauma and assist virus entry

Livestock Injection Product	Operator Exposure Risk	Recommended Treatment & First Aid Guidelines
Vax safe Newcastle Disease vaccine for poultry Note Websters ND vaccine has no such warnings	Eye: Following direct exposure, individuals allergic to the milk-derived buffer may experience immediate irritation and inflammation. Newcastle disease virus infection in the operator can also occur from eye contact of inhalation of the vaccine but is rare and usually mild, causing moderate conjunctivitis with flu like symptoms developing up to 72 hours later. Skin: No evidence risk for humans	Not available for general use. Requires Chief Veterinary Officer permit to use

Whilst due care has been taken with compiling this document it is not a complete list of all animal health products (vaccines, drenches, antibiotics and mineral supplements) that if accidentally self-administered have potential to cause injury.

No responsibility can be held by the authors for how this information is used and outcomes. Readers must independently verify recommendations contained in this document, as per below

Even for products assessed as being a low risk, if pain and swelling or other clinical signs develop after exposure to animal health products or any agricultural or veterinary chemical;

- seek immediate medical advice
- call the 1800 number on the product packaging and speak to the manufacturer
- Access the relevant MSDS (material safety data sheet) and it is safest to go direct to product manufacturer as most other websites including MIMS can be out of date (Note MSDS vary in quality)
- Contact Poisons Information Centre on 13 1126 and ask for medical information for practitioners
